PCE

PRCD-S+

Installation failure

L or N interrupt

Switch-on not possible - no power supply;
In case of interruption during operation all conductors switch off.

PE recognition

Switch-on not possible;
In case of interruption during operation all conductors switch OFF.

Installation failure

Switch-on not possible.

Under- / Over voltage

PLUS Switch-on not possible;

External failure

Leakage current $\geq 30\text{mA}$
($\geq 10\text{mA}$)

Switch-on not possible.
During operation L and N switch-off and
PLUS PE conductor circuit remains closed!

PE under voltage at
switch-on

Switch-on not possible.
PLUS Error recognition (glove!)

External voltage at PE

In case of external voltage on the
PE conductor L and N switch-off and
PLUS PE conductor circuit remains closed!

ONE-BUTTON
HANDLING

PLUS The classic „test button“ is eliminated. Before every switch-on procedure and during operation a **fully automatic** verification is performed in order to check the correct supply conditions.

PERFECT
PROTECTION

PLUS Switching on is only possible with **bare hand**. Measuring errors caused, for example, by the wearing of a glove when switching on are indicated by the signal unit flashing red. In this case, the PRCD-S+ from PCE gives a visual warning and **does not switch on**.

MAXIMUM
SAFETY

PLUS The PE conductor circuit is switched on in advance and switched off with a delay.

PLUS Failure situations like external voltage on the PE conductor or fault current above rated values cause an **interruption of L and N**. The **PE conductor stays closed** and keeps being monitored !

PLUS Overvoltage will be detected – the PRCD-S+ switches off or cannot be switched on.
